## Section 1.0 Introduction

### 1.1 Background

Culver City (City) is currently undergoing an update to the Safety Element of the City's General Plan as required by California Government Code Section 65302 to address the need to protect citizens from risks associated with natural and human-caused hazards. In parallel with the Safety Element, a Vulnerability Assessment is required to satisfy California Senate Bill (SB) 379 to identify risks climate changes poses to the local jurisdiction and the geographic areas at risk from climate change. The Vulnerability Assessment identifies specific natural hazards related to climate change and evaluates the City's vulnerabilities accordingly. The Vulnerability Assessment considers physical threats to critical facilities within the City as well as physical threats to residential and non-residential structures. The vulnerability findings will then inform adaptation and resilience goals, policies, objectives, and implementation measures in the Safety Element Update.

Hazards that may require an evacuation declaration include wildfires, floods, hazardous materials exposure, geologic hazards, and seismic hazards. This Evacuation Routes Assessment address the evacuation planning for potential emergency scenarios.

### 1.2 Legislative Overview

Under Assembly Bill (AB) 747 the City's Safety Element needs to address evacuation planning for any emergency scenarios that would warrant an evacuation of populations within the affected areas. The evacuation planning is a component of the Multi-Jurisdictional Hazard Mitigation Plan (MJHMP). This requirement became effective as of January 1, 2022 and is required for the development of a new or updated MJHMP. In addition, Senate Bill (SB) 99 also addresses local Safety Elements and emergency evacuation routes. This legislation requires the City to identify residential developments in hazard areas that do not have at least two emergency evacuation routes.

AB 1409 includes additional requirements for the Safety Element and MJHMP to be periodically reviewed and updated. It also requires that the MJHMP include evacuation locations in the evacuation route planning.

This Evacuation Routes Assessment report includes a capacity analysis that identifies evacuation routes and their capacity, safety, and viability under a range of emergency scenarios applicable to the local jurisdiction. This report contains important information that will serve as a resource to the Evacuation Coordinator, Emergency Manager, and emergency management support personnel to more quickly assess and plan mitigative actions for local hazard scenarios that may lead to the eventual need to order an emergency evacuation of all or a portion of populations within the City.

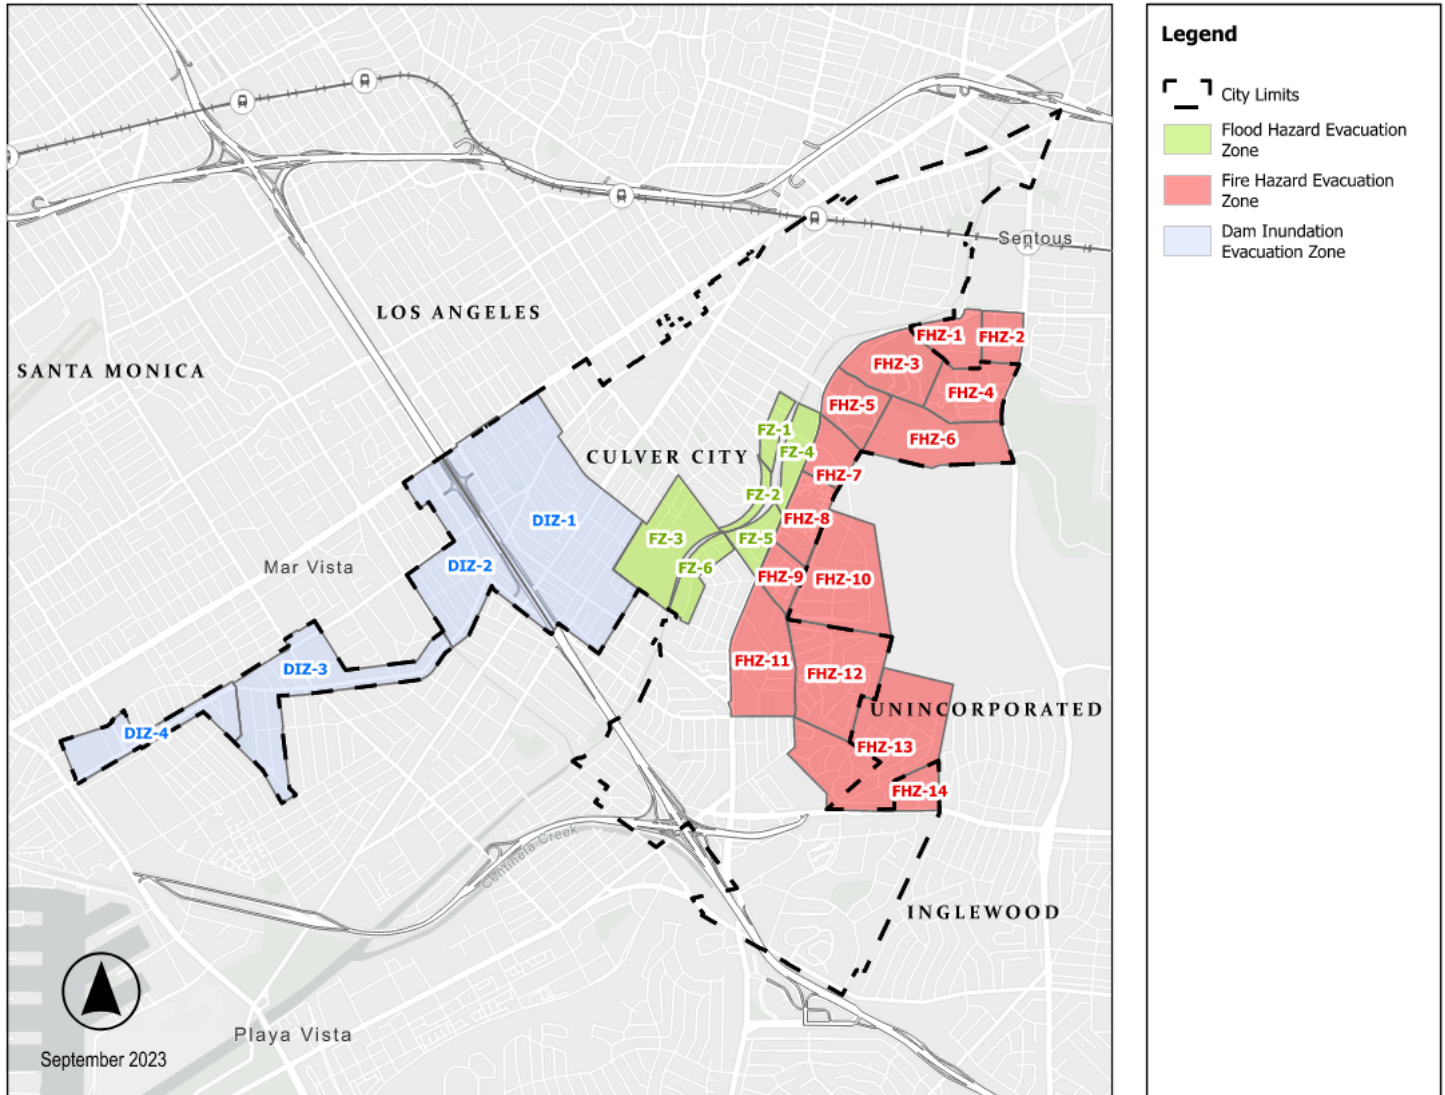

## Section 2.0 Evacuation Routes Assessment

### 2.1 Designated Evacuation Zones

Through coordination with the City's Planning and Development staff and the Fire Department, emergency evacuation zones were developed for each of three hazard scenarios. Designated evacuation zones for the City are illustrated in Exhibit 2-1.

**Exhibit 2-1  
Evacuation Zones**

## 2.2 Evacuation Reception Centers

Culver City has published a “*Disaster Preparedness Guide*”<sup>1</sup> to assist the community in promoting awareness and emergency preparedness. This guide provides direction for evacuation shelters within the City, including the following locations (refer to Exhibit 2-2):

- Culver City Senior Center – 4095 Overland Avenue
- Veterans Memorial Building – 4117 Overland Avenue
- Culver City Teen Center – 4153 Overland Avenue

As outlined in the guide, these pre-identified shelters have been vetted by the Red-Cross and can be used as long as individuals have been directed there by first responders and the shelter has not been damaged by a disaster. In addition, community members may also be directed to shelters outside of the City.

## 2.3 Evacuation Route Vulnerability Assessment

Evacuation route vulnerability can be expressed from several perspectives. The most direct expression of route vulnerability deals with physical features along an evacuation route that can be damaged during emergency scenarios and cause the evacuation route to be disrupted and unusable. These physical features include:

- Bridges (over rivers, creeks, and other drainage features)
- Bridges (creating grade separated roadways)
- Low points along the route that are prone to flooding
- Route locations along steep natural slopes that are prone to landslides

Evacuation route vulnerability can also be expressed in terms of vulnerability to residents where development areas are isolated and/or areas that have access to only one evacuation route. These areas are a concern and require additional advanced planning to address emergency scenarios where an evacuation is needed, and the single evacuation route may be blocked or damaged and cannot be used.

Exhibit 2-2 depicts physical features such as bridge structures along primary evacuation routes that may impede an evacuation if damaged at the time of an emergency which require an evacuation. The Vulnerability Assessment (separate cover) summarizes all of the critical facilities throughout. Table 2-1 below shows all of the bridges throughout the City, including those crossing the Ballona Creek and the Metro E (Expo) Line.

Also shown in Exhibit 2-2, are the following residential development areas (neighborhoods) that have only one access point to primary evacuation routes:

- Higuera Street Neighborhoods
- Palm Court Retirement Living
- Tompkins Way Neighborhood
- Clarmon Place Neighborhoods
- Huntley Avenue Neighborhoods
- Wade Street Neighborhood

---

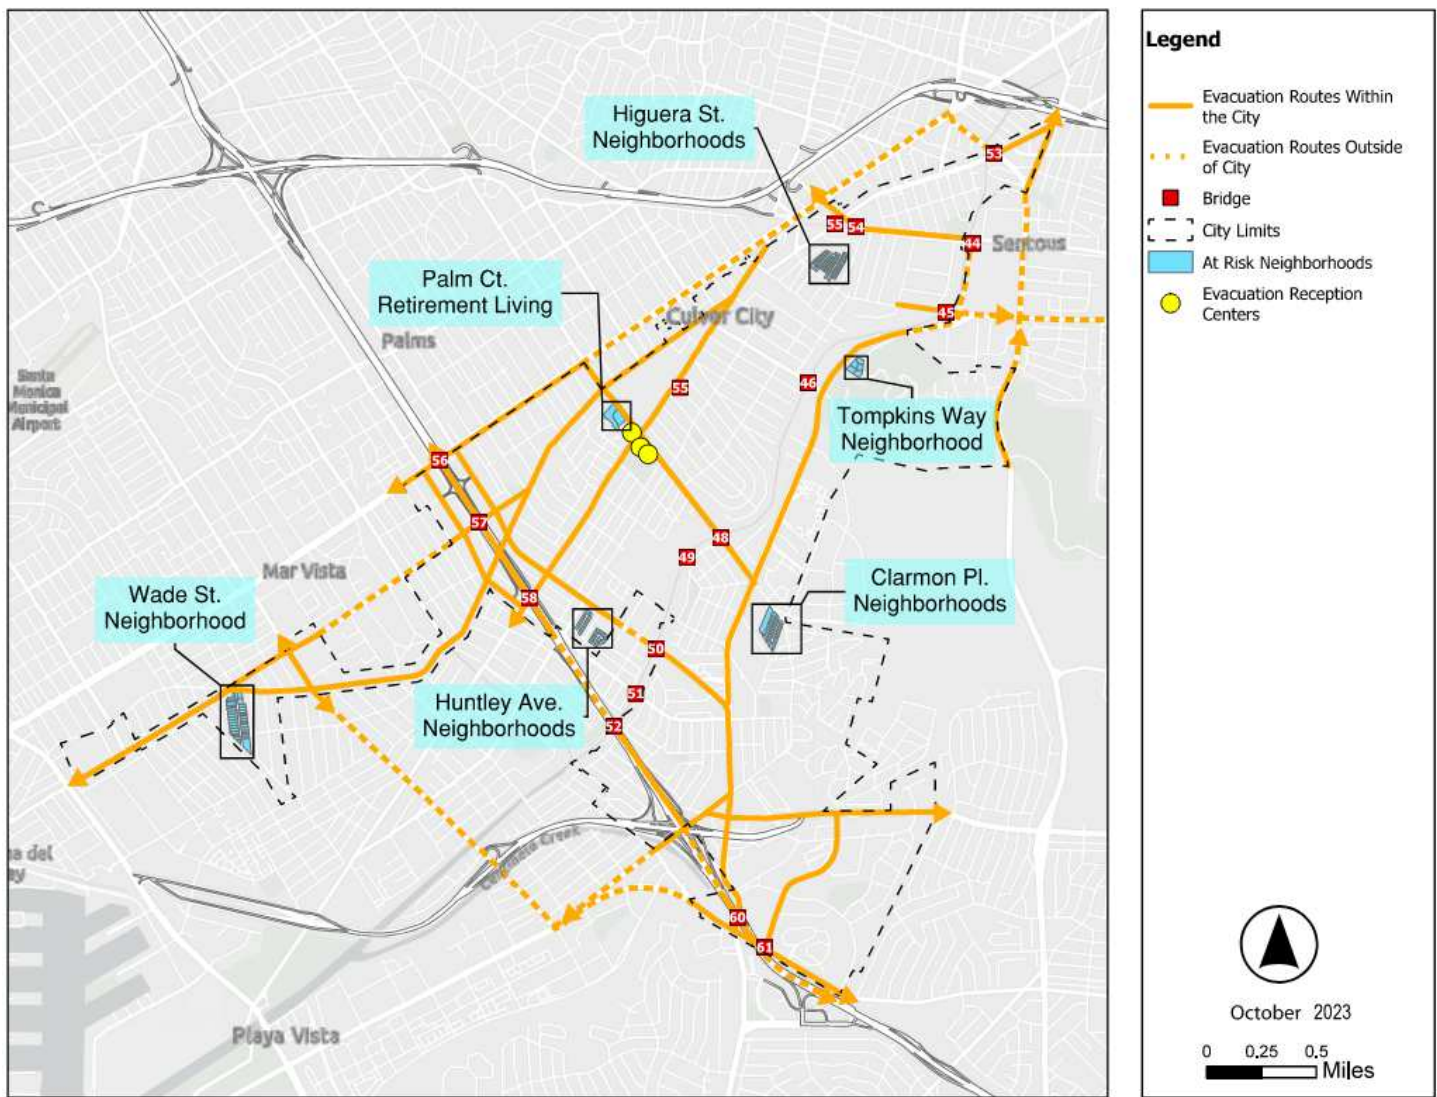

<sup>1</sup> <https://www.culvercityfd.org/files/sharedassets/fire/v/1/disasterpreparednessguide.pdf>

Of the potentially vulnerable neighborhoods identified above, the following are located within a Hazard Evacuation Zone:

- Fire Hazard Evacuation Zones
  - Tompkins Way Neighborhood (FHZ-3)
  - Clarmon Place Neighborhoods (FHZ-11)
- Flood Hazard Evacuation Zones
  - None
- Dam Inundation Evacuation Zone
  - Wade Street Neighborhood (DIZ-4)
  - Huntley Avenue Neighborhoods (DIZ-1)

In an evacuation scenario, these neighborhoods could be exposed to an increased risk due to the lack of egress opportunities and should be given earlier evacuation consideration.

## 2.4 Designated Evacuation Routes

Evacuation routes effectively include all improved (paved) roads within the City. Unpaved roads may be used in an evacuation as a last resort but should not be relied on as a primary evacuation route. Local streets typically serve local residential and commercial development. While local streets are not designed to accommodate high traffic volumes, they serve limited development areas and are rarely required to handle traffic flows that would exceed their capacities, even under full evacuation conditions.

For the purposes of evacuation planning, the designated evacuation route street network includes roadways that are classified as collectors and above including the following:

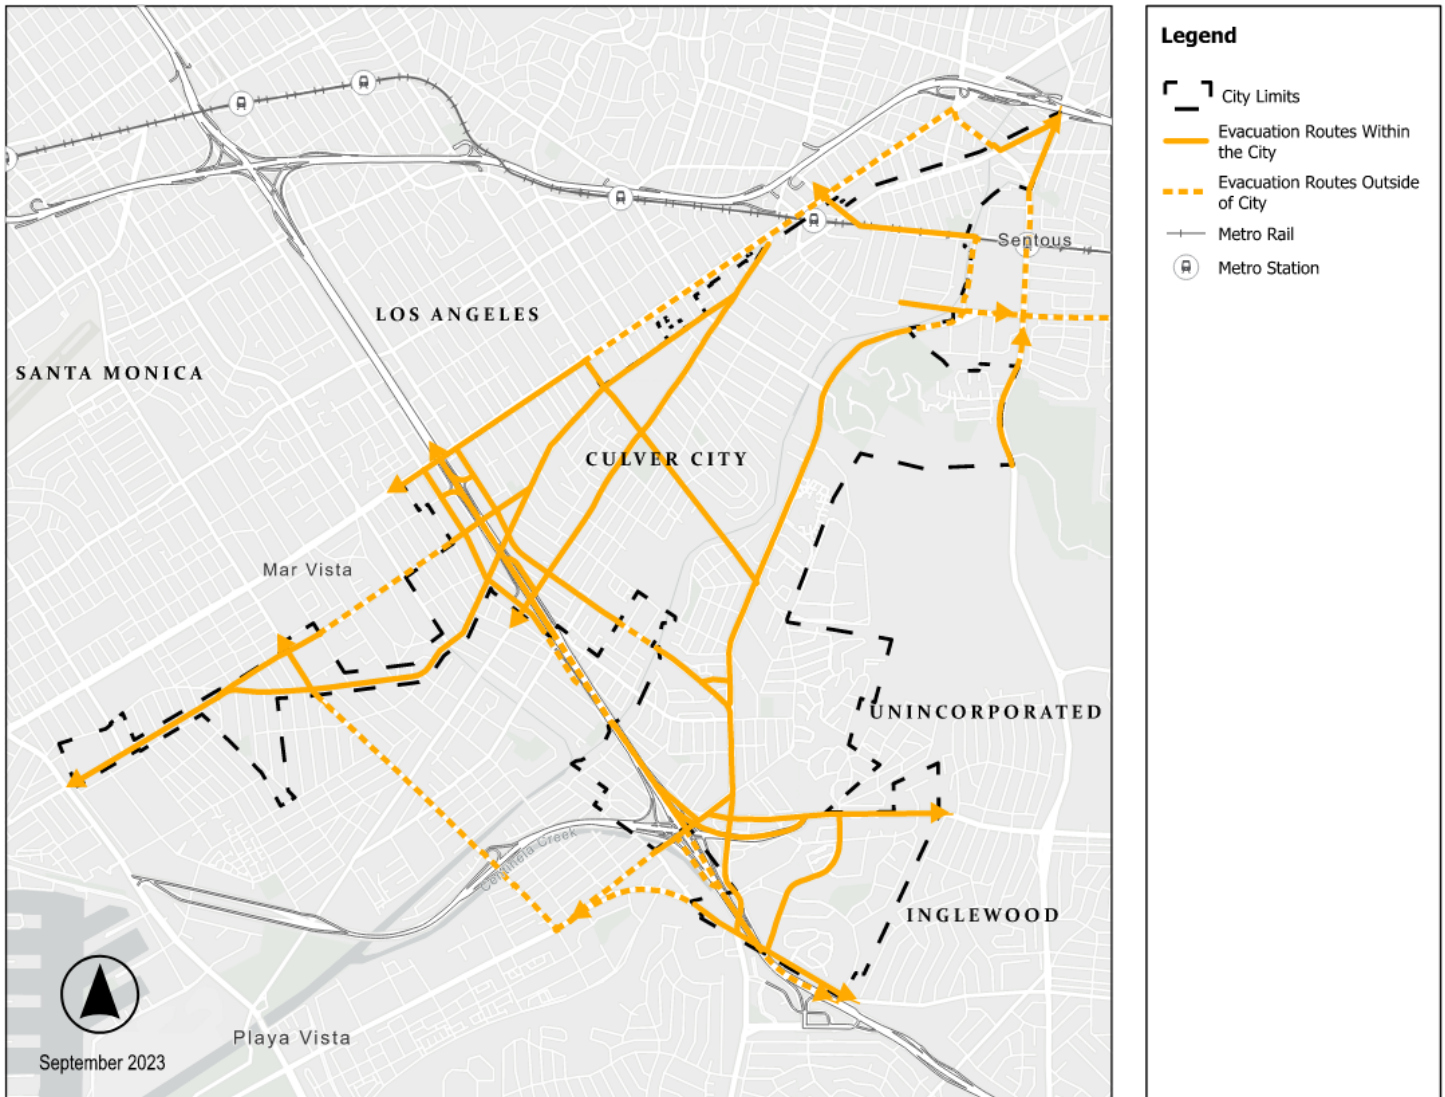

1. Freeways/Highways
2. Primary Arterials
3. Secondary Arterials
4. Neighborhood & Local Streets (in select areas)

Designated evacuation routes are the most reliable roadway facilities for the following reasons:

- These roads are designed to accommodate higher volumes of traffic in-line with their classifications.
- Access controls are more stringent on roads of higher classification.
- Intersection controls are designed to prioritize travel on roads of higher classification.
- Roadway maintenance policies prioritize roads of higher classification.

Primary evacuation routes are identified in Exhibit 2-3. Note that evacuation routes shown are to gateway exit points located at the City boundary. Additional evacuation routes would include those streets that lead to evacuation centers within the City.

### Exhibit 2-3 Primary Evacuation Routes

## 2.5 Evacuation Route Capacity

While the City's Circulation Element roadways are designed to serve two-way traffic, the designated evacuation routes are assumed to use only one direction of travel in the outbound direction away from the hazard. Once the evacuation order has been made, the inbound direction is typically reserved for emergency management vehicles to transport personnel and equipment towards the hazard.

The technical definition of the maximum capacity of a road is the maximum hourly rate at which vehicles can reasonably be expected to traverse a point during a given time period under prevailing roadway, traffic and control (free-flow) conditions. The capacity of an evacuation route considers the following factors:

- Design characteristics of the roadway (i.e., lane width, shoulder width, horizontal and vertical alignment, presence of raised median)

- Number of lanes in the outbound evacuation direction
- Access control
- Percent truck traffic

The maximum “free-flow” (uninterrupted flow) capacity of a roadway segment occurs at level of service (LOS) E when the vehicle speed and vehicle spacing is at its optimum level. Under the free-flow condition, the traffic demand is fully serviced, and the service volume increases as the traffic volume and density increase, until the service volume reaches the maximum LOS E capacity for the roadway segment. As traffic volumes and the resulting vehicle density increase beyond this “critical” value, the rate at which traffic can be serviced quickly drops below the maximum capacity. Therefore, to realistically represent traffic handling capacity during congested forced flow conditions (such as during an evacuation) it is necessary to apply a capacity reduction factor. A capacity reduction factor of 0.9 (10% reduction) has been applied based upon studies that identified a fall-off in the maximum service flow rate (e.g., maximum capacity) when congestion occurs at “choke points” on a freeway segment. The estimated hourly vehicle capacities under forced flow evacuation conditions are summarized in Table 2-2 for each of the five designated evacuation route classifications.

**Table 2-2**  
**Hourly Roadway Evacuation Capacity**

| Classification      | No. Lanes<br>(per direction) | Capacity/Lane<br>(vphpl) | Reduction<br>Factor | Total Capacity<br>(veh. in<br>outbound<br>direction) | Diminished<br>Capacity <sup>(1)</sup><br>(veh. per<br>direction) |
|---------------------|------------------------------|--------------------------|---------------------|------------------------------------------------------|------------------------------------------------------------------|
| Freeway             | 7                            | 1,900                    | 0.9                 | 11,970                                               | 8,380                                                            |
| Primary Arterial    | 3                            | 1,900                    | 0.9                 | 5,130                                                | 3,590                                                            |
| Primary Arterial    | 2                            | 1,900                    | 0.9                 | 3,420                                                | 2,390                                                            |

vphpl = Vehicles per Hour per Lane

<sup>(1)</sup> Assumes 30% of the available capacity will be consumed by ambient/background (non-evacuation) traffic.

It is important to note that the hourly evacuation capacity estimates noted in Table 2-1 may not be fully available to evacuating traffic during the early stages of an evacuation unless strict perimeter traffic control/access has been established before the evacuation order has been given. Depending on the time of day, conditions without positive perimeter traffic control could result in background (non-evacuation) traffic consuming between 25% and 30% of the available capacity during midday and non-peak periods.

Peak period background traffic on some higher classification roadways (including those that access freeway interchanges) could represent between 70% and 100% of the available capacity. If an evacuation occurs during peak periods, perimeter traffic control will be more crucial and certain evacuation routes may not be available for use. Conversely, during late evening and early morning periods, available roadway capacity on non-freeway routes would be greater than 90% of the maximum capacity.

At grade intersection controls at locations where two designated evacuation routes merge are also an important consideration during an evacuation. The approaches to at-grade intersections are where flow can be “interrupted” by a control device or by turning or crossing traffic at the intersection. Due to the differences in the flow conditions at intersections, separate estimates of

capacity must be made for these locations. In many instances, the approach to the intersection is widened through the addition of one or more lanes (turn bays), to compensate for the lower capacity of the approach caused by the interruption of traffic flow due to the intersection control device.

Minor intersections are typically controlled by “stop” signs on the minor street approach(es) or at all intersection approaches if the streets serve similar traffic volumes. Arterial street intersections are typically controlled by traffic signals and the amount of green signal time is assigned to the intersection approaches based on the relative traffic volumes.

During an evacuation, at-grade intersections will likely become the first bottleneck locations once the evacuation is fully underway. During these conditions where traffic flows are concentrated in one direction and normal opposing traffic turning conflicts do not require signal intervention, traffic signals will not be able to efficiently manage the unique traffic demand pattern. This anticipated condition will result in the need to allocate right-of-way time to the respective competing traffic flows by imposing some form of proactive control. During evacuation conditions, control at the most critical intersections will often be provided by designated traffic control crews. In these cases, manual traffic control would supersede the normal stop sign or traffic signal control devices.

## 2.6 Distance & Travel Time to Evacuation Gateways

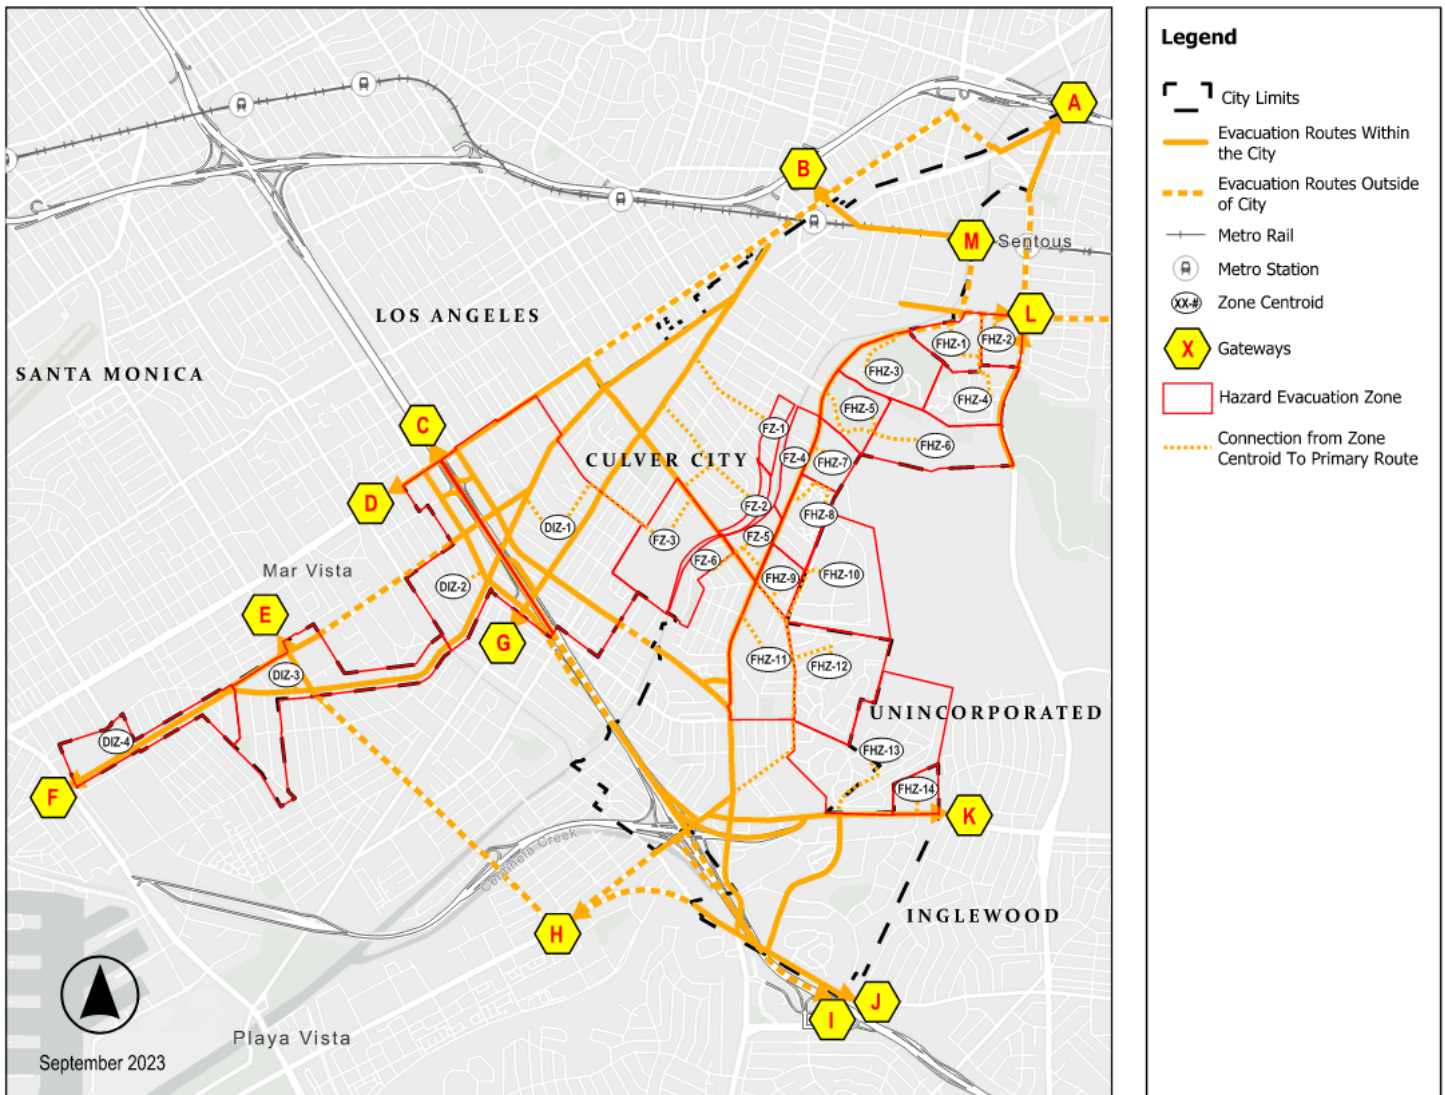

As part of the evacuation route assessment, the most direct evacuation routing from the evacuation zones shown in *Exhibit 2-1* to the closest primary evacuation gateways exiting the City was identified. City evacuation route gateways include the following:

- Gateway A – Washington Boulevard (East)
- Gateway B – National Boulevard (North-West)
- Gateway C – I-405 (North-West)
- Gateway D – Venice Boulevard (South-West)
- Gateway E – South Centinela Avenue (North-West)
- Gateway F – West Washington Boulevard (South-West)
- Gateway G – South Centinela Avenue (South-East)
- Gateway H – Culver Boulevard (South-West)
- Gateway I – Jefferson Boulevard (South-West)
- Gateway J – I-405 (South-East)
- Gateway K – West Centinela Avenue (South-East)
- Gateway L – Slauson Avenue (East)
- Gateway M – Obama Boulevard (East)
- Gateway N – West Jefferson Boulevard (North)

It should be noted that not all evacuation zones were assigned to each Gateway. A centroid was placed at logical cross-streets approximately in the center of each zone (or sub-zone) as shown in *Exhibit 2-4*. Recommended evacuation traffic routing was then assigned from the centroid to the most convenient Gateway shown above.

## Exhibit 2-4 Evacuation Zone Centroids & Gateways

As a measure of evacuation vulnerability, travel time to each of the primary gateways was estimated for populations within each of the evacuation zones. To estimate the travel time from the centroid to the destination Gateway, the length of individual roadway segments, posted speed limits on each segment, and traffic control devices along the route (all-way stop, side-street stop, and traffic signal) were identified for each evacuation route. Travel time for each route segment was calculated based on the travel distance and posted speed. Typical intersection delay was estimated separately and was added to the segment travel time. An average delay factor of 20 seconds was used for each signalized intersection along the evacuation route. If an evacuation route passed through an unsignalized intersection, a delay factor of 10 seconds was applied if the routing passed through a stop-controlled approach. The sum of the individual roadway segment travel times and the total intersection delay were used to estimate the total travel time. A summary of the travel time estimates for each zone to the various Gateways is included in Attachment A.

It is important to note that the estimated travel time is not an estimate of evacuation time, it is simply a calculation of uncongested, free-flow travel from the centroid of the evacuation zone to the assigned Gateway. As multiple zones are evacuated over time, the cumulative evacuation traffic will approach the roadway capacity and may eventually exceed the available capacity of an evacuation route as they get closer to the evacuation Gateways. This results in congested conditions which would reduce the travel speed, and therefore increase the travel time to a Gateway.

As mentioned above, the assignment of emergency response crews at key locations to control the flow of traffic would help to significantly reduce delay times. While the free-flow travel time does not represent the evacuation time, it does provide a relative measure of the evacuation zones that would be subject to longer evacuation times. An evacuation order should consider these more remote areas and they should be prioritized in the sequencing of evacuation notifications.

The timing of evacuation notifications should consider the following factors that affect evacuation time:

1. Evacuee response time to evacuation notification (i.e. time for all evacuees to receive warning and time to prepare to leave home);
2. Estimated travel time to evacuation route gateway; and
3. Estimated added delay time due to evacuation route capacity constraints.

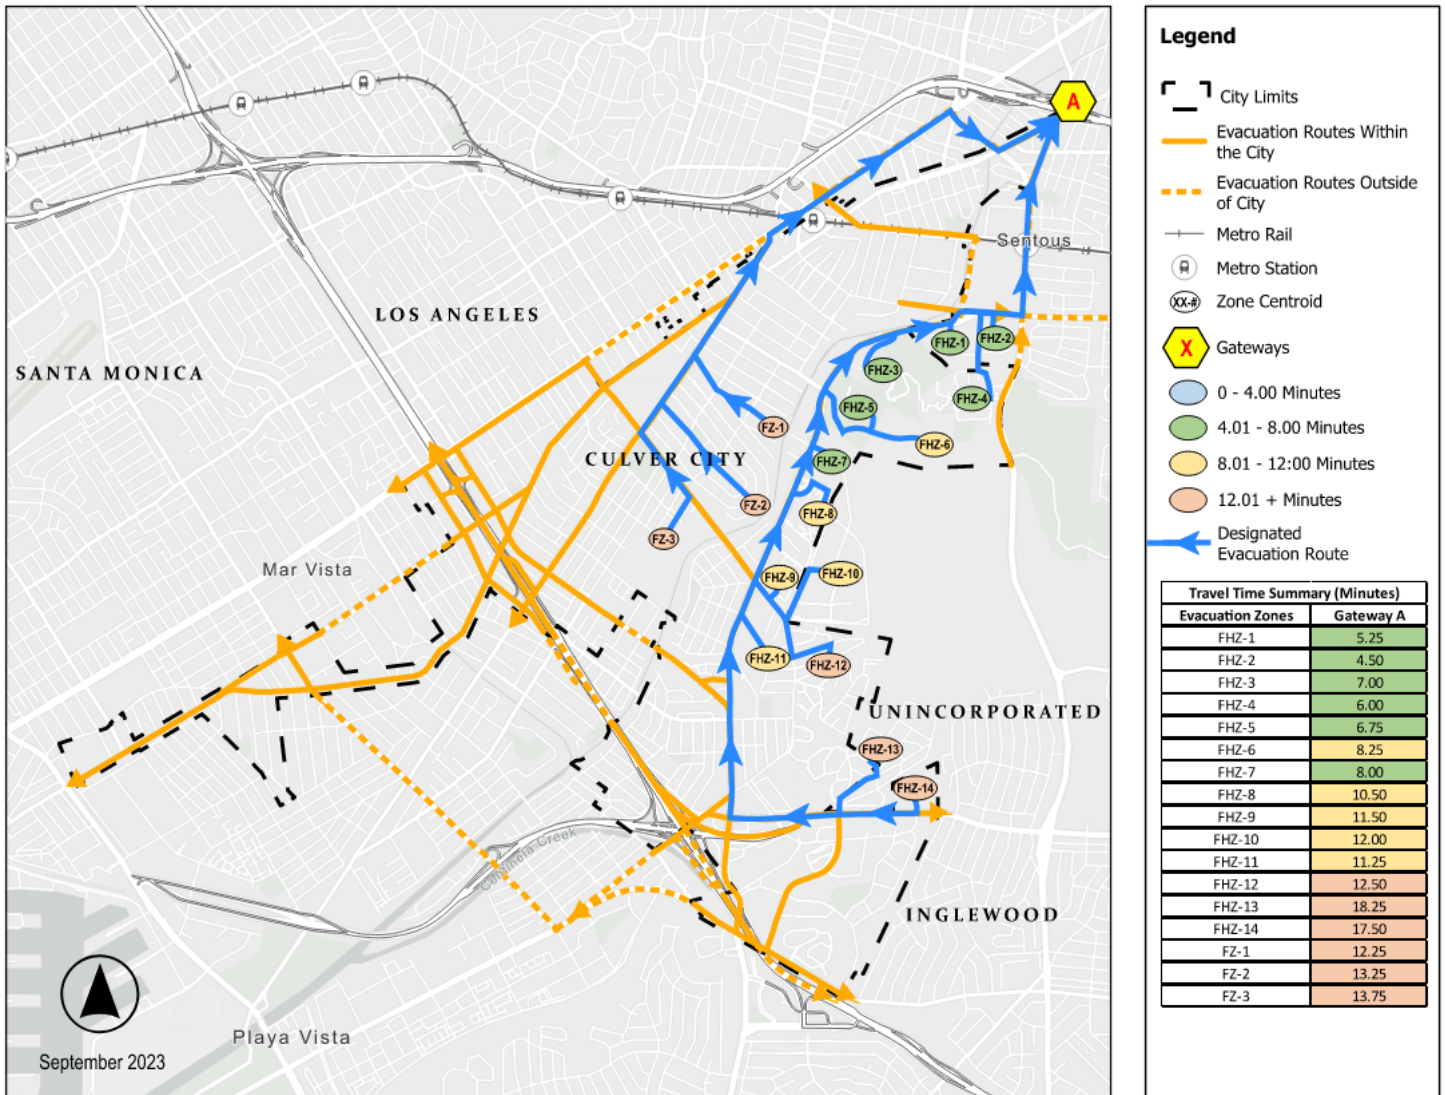

If the critical roadway segment that will have the limiting capacity during an evacuation can be identified, the approximate evacuation time can be calculated by dividing the number of evacuating vehicles using the critical roadway segment by the outbound capacity of the critical roadway segment. The critical segment could be close to the evacuation zone in cases where the evacuation is limited to one or two zones. In cases where multiple zones are evacuated at the same time, the critical roadway link will likely be closer to the evacuation route gateway where the accumulation of evacuating traffic is the greatest.

Exhibit 2-5 through Exhibit 2-17 identify the designated evacuation route from the centroid of each evacuation zone to assigned Gateways throughout the City and summarize the travel times to individual Gateways. Exhibit 2-18 through Exhibit 2-20 shows the evacuation route to the nearest Gateway for each evacuation zone for each hazard scenario (fire, dam inundation, & flood). Table 2-3 summarizes the travel time estimates rounded to the nearest quarter of a minute (15 seconds).

### Exhibit 3-1 Manual Traffic Control Points

The need for manual traffic control at these locations will be determined by the Evacuation Coordinator and Emergency Operations Manager. Locations that should have manual traffic control established will depend on the hazard scenario being addressed and the evacuation zones that are ordered to be evacuated. In most cases, the City's Police Department would be responsible for providing the crew needed for the manual traffic control function.

## Section 4.0 Primary Evacuation Scenarios

Through coordination with the City's Public Works Department, Los Angeles County Sherriff's Department and the Los Angeles County Fire Department, three representative emergency scenarios have been identified which would require an evacuation of populations within select evacuation zones within the City. The two emergency scenarios include a potential fire hazard scenario and a potential dam inundation scenario. The following sections present a discussion of each emergency scenario along with the identification of corresponding evacuation procedures and recommendations for facilitating the evacuation in the event of a significant emergency.

### 4.1 Scenario 1 – Wildfire Hazard

This scenario represents a potential fire hazard approaching from the east through the Inglewood Oil Fields and Baldwin Hills burning towards the City limits. As identified in the Vulnerability Assessment, portions of the City along the easterly boundaries are identified as *very high hazard zones* – see Attachment B. A wildfire in any of these zones could potentially spread into the City and threaten residential structures but are unlikely to immediately impact critical facilities.

As shown in Table 4-1, facilities within the fire hazard zones include the El Rincon Elementary, Marycrest Manor, parks, and the Overland Sewer Pump Station.

**Table 4-1  
Facilities in a Wildfire Hazard Zone**

| Map ID | Name                                                      | Asset Type           | Evacuation Zone |
|--------|-----------------------------------------------------------|----------------------|-----------------|
| -      | El Rincon Elementary                                      | Public School        | FHZ-12          |
| 12     | Marycrest Manor - Skilled Nursing Facility (Culver Crest) | Non-Profit/NGO       | FHZ-12          |
| 15     | Blanco Park                                               | Parks and Recreation | FHZ-11          |
| 19     | Blair Hills Park                                          | Parks and Recreation | FHZ-4           |
| 21     | Culver City Park (Botts Field)                            | Parks and Recreation | FHZ-5           |
| 43     | Overland Sewer Pump Station                               | Utility - Wastewater | -               |

*Table 4-2* summarizes the number of residential buildings for each of the evacuation zones within the fire hazard zone and the estimated number of vehicles associated with these residences. The estimated number of personal vehicles is based on vehicle ownership data provided by the Southern California Association of Governments (SCAG) *2022 Spatial and Statistics Summary* for the City.

**Table 4-2  
Wildfire Hazard Zone Demographics**

| Zone         | Estimated Number of Residences | Estimated Number of Personal Vehicles |
|--------------|--------------------------------|---------------------------------------|
| FHZ-1        | 0                              | 0                                     |
| FHZ-2        | 384                            | 630                                   |
| FHZ-3        | 7                              | 11                                    |
| FHZ-4        | 183                            | 300                                   |
| FHZ-5        | 0                              | 0                                     |
| FHZ-6        | 0                              | 0                                     |
| FHZ-7        | 0                              | 0                                     |
| FHZ-8        | 237                            | 389                                   |
| FHZ-9        | 530                            | 870                                   |
| FHZ-10       | 0                              | 0                                     |
| FHZ-11       | 92                             | 151                                   |
| FHZ-12       | 406                            | 667                                   |
| FHZ-13       | 0                              | 0                                     |
| FHZ-14       | 0                              | 0                                     |
| <b>Total</b> | <b>1,839</b>                   | <b>3,018</b>                          |

If a fire hazard were to occur in the hills and oil fields to the east of the City, Evacuations Zones FHZ-2, FHZ 4, and FHZ-6 as well as Zones FHZ-12 through FHZ-14 would potentially experience the highest risk since they are located along the City's eastern boundary closest to the fire hazards. Residents in each of these zones should be directed to travel west, away from the fire hazard. As shown in the travel time assessment above, the closest gateway to these zones are Gateway L and Gateway K respectively, however depending on the nature, origin, and direction of a potential fire hazard, these Gateways may lead them closer to the hazard and alternative evacuees should be directed toward other gateways. The estimated travel time these zones to the closest gateways ranges from 1.00 minute to approximately 3.5 minutes; however, as discussed in Section 1.2.6, these travel time estimates are not equivalent to evacuation times.

The evacuation routes serving these hazard zones include Obama Boulevard, Jefferson Boulevard, and Slauson Avenue. Each of these roadways are 4-lane facilities (two lanes in each direction) with a one-way outbound evacuation capacity of 2,390 vehicles-per-hour-per-lane (vphpl). In total, all fire hazard evacuation zones have an estimate of 1,829 dwelling units, or approximately 3,018 vehicles that could potentially be evacuated due to a fire hazard. However, with the multiple evacuation route options available to residents, it is unlikely that each resident would take exactly the same route. Therefore, the available capacity of the roadway network is forecast to be sufficient for this scenario. To avoid significant congestion, incremental evacuation of these zones should be considered if advanced warning of the fire hazard permits.

## 4.2 Scenario 2 – Dam Inundation

This scenario represents a potential failure at the Stone Canyon Dam and Reservoir which lies approximately 6.7 miles to the northwest of the City limits. A failure at the dam could potentially inundate residential neighborhoods and critical facilities shown in *Table 4-3*. Dam inundation maps are provided in Attachment C.

A failure at Stone Canyon Dam and Reservoir would initially threaten the homes along the north-westerly boundary of the City between South Centinela Avenue and Huron Avenue before potentially spreading into the City. The inundation maps show that flood waters flow down hill following lower elevations toward the City and would reach a maximum depth of approximately 2-5 feet on average and potentially up to approximately 5-10 feet in locations of low elevation. The maps show floodwaters would reach Fire Station 2 within 1 hour and 50 minutes with a maximum flood depth of 5 feet.

This flooding would potentially impact the availability of evacuation routes and could hinder the efficient transportation in the event of an emergency evacuation. Evacuation routing should follow a path to higher ground elevation away from the flood zone (i.e., northeast or southwest). It should be noted that the I-405 freeway is predominately elevated roadway and is not shown to be substantially impacted by this inundation scenario.

**Table 4-3  
Facilities in a Dam Inundation Hazard Zone**

| Map ID | Name                                          | Asset Type              | Evacuation Zone |
|--------|-----------------------------------------------|-------------------------|-----------------|
| 4      | Fire Station No. 2                            | Government Building     | DIZ-2           |
| -      | El Marino Language School                     | Public School           | -               |

| 50     | Sepulveda Boulevard Bridge over Ballona Creek | Transportation - Bridge | -               |
| 51     | Sawtelle Boulevard Bridge over Ballona Creek  | Transportation - Bridge | -               |
| 52     | I-405 Freeway Bridge over Ballona Creek       | Transportation - Bridge | -               |

*Table 4-4* summarizes the number of residential buildings for each of the evacuation zones effected by the dam inundation hazard scenario and the estimated number of vehicles associated with these residences.

**Table 4-4  
Dam Inundation Hazard Zone Demographics**

| Zone  | Estimated Number of Residences | Estimated Number of Personal Vehicles |
|-------|--------------------------------|---------------------------------------|
| DIZ-1 | 1,454                          | 2,387                                 |
| DIZ-2 | 876                            | 1,438                                 |
| DIZ-3 | 826                            | 1,356                                 |
| DIZ-4 | 249                            | 409                                   |
| SUM   | 3,405                          | 5,590                                 |

Dam Inundation Zones DIZ-2 and DIZ-3 would be immediately threatened by this potential hazard. Zone DIZ-2 should be directed to utilize I-405 to head southwest to Gateway I (nearest) and could potentially evacuate an estimated 876 dwelling units, or 1,438 vehicles. The constraining point to accessing the I-405 freeway would be the on-ramp at Braddock Drive with a one-way capacity of 1,200 vehicles-per-hour-per-lane (vphpl). Zone DIZ-3 should be directed southwest on Washington Blvd, which is a 4-lane facilities (two lanes in each direction) with a one-way outbound evacuation capacity of 2,390 vehicles-per-hour-per-lane (vphpl).

With the multiple evacuation route options available to residents, it is unlikely that each resident would take exactly the same route. To avoid significant congestion, incremental evacuation of these zones should be considered if advanced warning of the flood hazard due to the dam breach permits.

Given the distance to Stone Canyon Dam and Reservoir, Inundation maps show that flood waters will reach the City in just under two hours. Given the time between the dam breach and flooding effects that would impact or make evacuation routes unusable, it will be critical to develop advance warning methods that would identify a likely breach of the dam so the preemptive evacuation order could be given. One such example would be an earthquake event that causes damage to the dam but does not immediately cause a dam breach. Under some emergency scenarios such as an earthquake that does cause immediate rupture or dam breach, it may not be possible or practical to declare a vehicle-based evacuation and a shelter in place order may be more appropriate.

### 4.3 Scenario 3 – Flood Inundation

This scenario represents a potential flooding of Ballona Creek which would potentially inundate residential neighborhoods and critical facilities shown in *Table 4-5*. Flood inundation maps are provided in [Attachment D](#).

While not located in a *Special Flood Hazard Area*, the zones assessed for this specific scenario have been included at the request of City staff. Based on historic storm events, the “S-curve” near Culver City High School has experienced water cresting the concrete channel and entering the adjacent properties and roadways.

**Table 4-5  
Facilities in a Flood Inundation Hazard Zone**

| Map ID | Name                                             | Asset Type              | Evacuation Zone           |
|--------|--------------------------------------------------|-------------------------|---------------------------|
| -      | High School                                      | Public School           | FZ-3                      |
| -      | Middle School                                    | Public School           | FZ-3                      |
| -      | Office of Child Development                      | Public School           | FZ-3                      |
| -      | Adult School                                     | Public School           | FZ-3                      |
| 23     | Lindberg Park                                    | Parks and Recreation    | FZ-6                      |
| 41     | Jasmine Sewer Pump Station                       | Utility - Wastewater    | -                         |
| 48     | Overland Avenue Bridge over Ballona Creek        | Transportation - Bridge | FZ-2 / FZ-3 / FZ-5 / FZ-6 |
| 49     | Ocean Drive Pedestrian Bridge over Ballona Creek | Transportation - Bridge | FZ - 3 / FZ -6            |

*Table 4-6* summarizes the number of residential buildings for each of the evacuation zones effected by the flood inundation hazard scenario and the estimated number of vehicles associated with these residences.

**Table 4-6  
Flood Inundation Hazard Zone Demographics**

| Zone | Estimated Number of Residences | Estimated Number of Personal Vehicles |
|------|--------------------------------|---------------------------------------|
| FZ-1 | 94                             | 154                                   |
| FZ-2 | 47                             | 77                                    |
| FZ-3 | 88                             | 144                                   |
| FZ-4 | 0                              | 0                                     |
| FZ-5 | 0                              | 0                                     |
| FZ-6 | 83                             | 136                                   |
| SUM  | 312                            | 511                                   |

Residents required to evacuate should be directed away from Ballona Creek towards Jefferson Blvd and Culver Blvd in the case that the bridges spanning the creek are flooded. The travel time assessment reflects this. Jefferson Blvd and Culver Blvd are both 4-lane facilities (two lanes in each direction) with a one-way outbound evacuation capacity of 2,390 vehicles-per-hour-per-lane (vphpl). Flood inundation evacuation zones FZ-1 through FZ-3 have a combined estimate of 229 dwelling units, or approximately 375 vehicles that could potentially be evacuated due to a flood hazard on the west side of Ballona Creek. Flood inundation evacuation zones FZ-4 through FZ-6 have a combined estimate of 83 dwelling units, or approximately 136 vehicles that could potentially be evacuated due to a flood hazard on the east side of Ballona Creek. It should be noted that these demographics include residential structures only, and the majority of the land uses within these evacuation zones are non-residential uses.

Notes:

1. The information shown on this map is approximate and should be used as a guideline for emergency response and preparation purposes.
2. This inundation map has been prepared in accordance with sound engineering practices and the analysis has been performed correctly to the best of the engineer's knowledge.
3. All elevations are reported in the NAVD88.
4. The basemap is provided for reference only and does not necessarily represent actual conditions at the time of the study. Basemap: ESRI, World Imagery, updated 5/16/2018, [http://goto.arcgisonline.com/maps/World\\_Imagery](http://goto.arcgisonline.com/maps/World_Imagery)
